

Reimagining the Marketplace

The existing Marketplace is already a strong product - it brings together multiple solutions with rich profiles, AI-embedded search and requirements analysis. The challenge is both in visibility & aligning to how end users actually approach solution identification

CURRENT STATE

Consulting Marketplace

A comprehensive source of data, with challenges around visibility & knowledge and changing pace of technology

People don't know what they need

- Users may describe a problem but unaware of the key solution decision points
- Interface assumes technical familiarity; AI agent helps but misses implementation

Solutions go beyond just EY-developed assets

- Limited to knowledge on internally-developed solutions, missing wider landscape
- Microsoft out-of-the-box AI tools available for users with minimal friction to start

Technology outpaces static catalogues

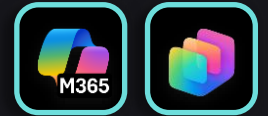

- Content goes stale, solution develop quicker than content refreshes
- Typically, nobody owns data refresh end-to-end

Another platform risks adoption

- Separate proprietary platform that requires a deliberate visit
- Needs to be embedded into the core workflows users already interact with

FUTURE STATE

Solution Consultant Agent, *embedded in M365 Copilot*

An agent published to Teams and M365 Copilot that reasons across our internal catalogue alongside the live Microsoft ecosystem, to provide digestible information in the platforms they're already using

FULL TECHNOLOGY LANDSCAPE

Bring together internally-developed solutions with external options, including Microsoft 1st Party agents

MEET USERS WHERE THEY ARE

Embed into M365 Copilot and Teams, with Outlook & SharePoint interactivity

UNDERSTAND BUSINESS PROBLEMS

Behave like a real solution architect, providing solutions based on key factors like cost and availability

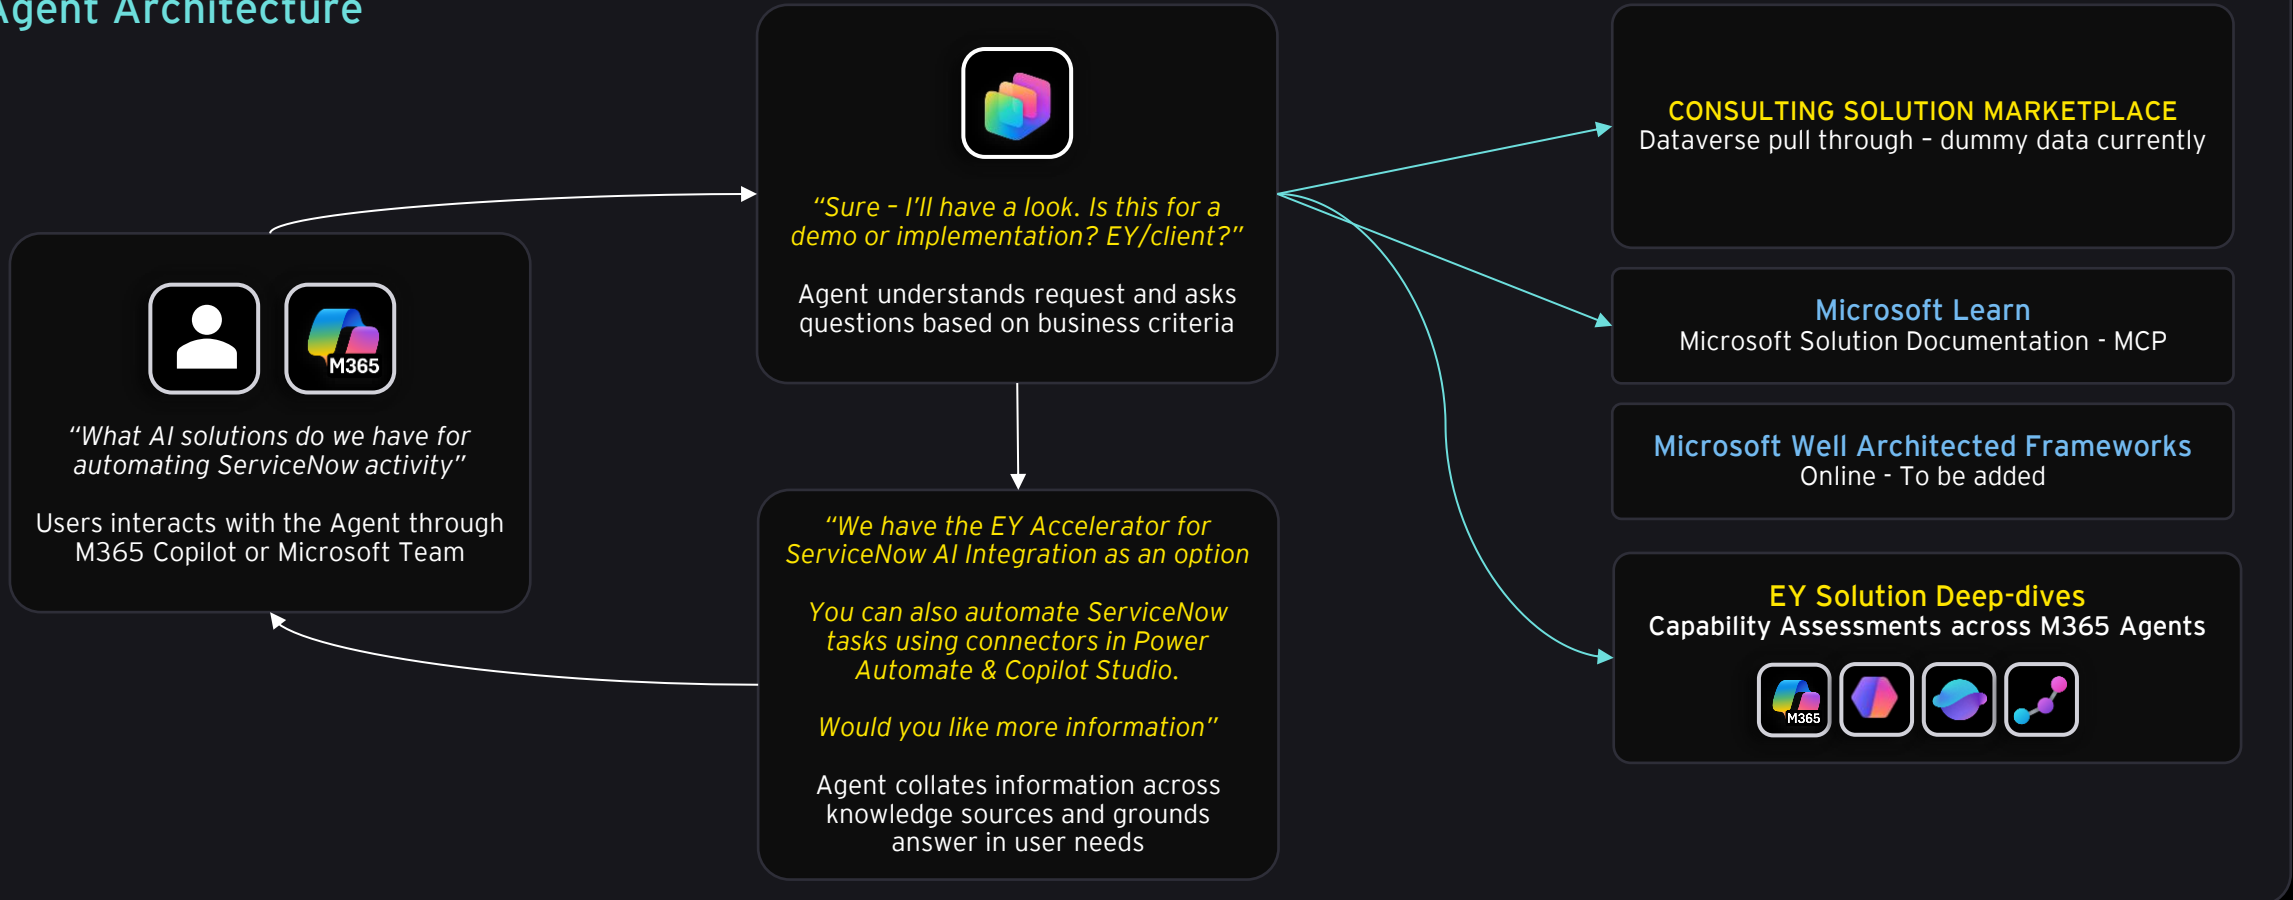

SHOWS ITS REASONING

Clearly articulates source material and justification for decisions, giving user full transparency of data and gaps

Prototyping the vision

An indicative prototype to demonstrate the interaction pattern and validate the approach - a starting point

Agent Architecture

Next steps & considerations

Moving beyond prototype includes expanding capabilities and engaging EY Governance for safe roll-out. Whilst the current approach is likely the quickest path to production, it does bring limitations, mostly due to Copilot Studio functionality.

Immediate

1-2 WEEKS

- Populate with real catalogue data and enrich with reference documentation
- Embed EY developed thought leadership for solution development
- Build adaptive card templates for solution responses with action buttons
- Expand categorisation taxonomy - cost, maturity, access model etc
- Refine user journeys based on testing

Medium-term

4-6 WEEKS

- Solution routing logic - pattern-based classification
- Deeper integration with existing marketplace AI engine (requirements, scoring)
- Power Apps integration (pending agent integration General Availability release)
- Initiate conversations with EY Enterprise Technology on industrialisation
- Explore wider integration with M365 Agent Marketplace Agents

Limitations & Considerations

ROUTE TO PRODUCTION (GOVERNANCE)

Copilot Studio Agents have a dedicated governance process to complete before being published widely. May require additional environment set up

UX & INTERFACE

Clear user journeys to be defined, additional work on ensuring interface is seamless and intuitive - currently limited to adaptive cards and topic flows

KNOWLEDGE CURATION

Requires a defined approach for ensuring knowledge is verified and ingested continually, specifically for internal tools and expert guidance

ROUTING EXPERTISE

Decisioning & Routing requires real knowledge share from solution architects + includes some level of subjectivity. Need to ensure clear process in place for capture and ingest

COPILOT STUDIO PERFORMANCE

Orchestration accuracy, latency, and throughput needs to be tested at required scale, with components migrated from Studio to Foundry

DATA REFRESH

Controls in place to ensure external live data refresh is working and validated. Internal solution data will continuously update, needs a set process
