

Scene Talk-Track — How to Present Every Step

A shared narration for the **iteration 4 (v4)** prototype (the Avonmore / M&A story).

The goal: **anyone on the team can stand up and explain any step** — what it is, what it does, every feature on the screen, and the point it lands — without having built it.

Each scene has five parts:

- **In one sentence** — the single line to lead with
- **What's on screen** — what the audience is looking at
- **The talk-over** — the words to say, roughly as spoken
- **Features on this step** — every feature on the screen, and how to explain each one
- **The point** — the one idea to make sure lands before you move on

Keep it conversational. The prototype is the proof; your job is the story around it.

About v4. Iteration 4 is the same 10-scene lifecycle and narrative as v3, restyled around one principle: **one concept = one card**. Three previously dense scenes — **Ignition**, **Deal Structuring** and **Relationship Review** — are broken into discrete, labelled cards so each idea reads on its own. Every other scene is carried over unchanged. Where v4 splits a scene into cards, the feature table below follows those cards in order.

The story in 30 seconds (say this once, up front)

Daisy Bennett is a Senior Relationship Manager. For seven years she's covered **Avonmore Components**, a Midlands manufacturer — her main contact is the Group CFO, **Sarah Whitfield**. This week Avonmore has quietly **acquired Calderwood Engineering**, a precision-engineering firm that Lloyds *also* banks — but through a different RM, **Marcus Reed**, in a different coverage team.

So two Lloyds clients have just become **one group — the Avonmore Group** — a roughly **£12m acquisition-and-integration mandate**. That is a moment of both opportunity and risk, and today it depends entirely on whether Daisy spots it and moves before competitors do.

Running underneath all of this is **REO** — the orchestrating intelligence. REO is not a chatbot and not "a bunch of agents". It's the always-on layer that watches, surfaces,

drafts and coordinates — while **Daisy stays in charge of the relationship and the judgement.**

The 10 scenes follow that one deal from first signal to closed mandate and into the next cycle.

The cast, at a glance:

Who	Role
Daisy Bennett	Senior RM, our protagonist — covers Avonmore
Sarah Whitfield	Group CFO of Avonmore — the client in the room
Avonmore Components	Daisy's 7-year client, the acquirer
Calderwood Engineering	The acquired firm — already a Lloyds client
Marcus Reed	The other RM, covers Calderwood (different team)
REO	The orchestrating AI — the enabler behind every scene

Scene 1 · Opportunity Ignition

A reason to call today — surfaced and qualified before you dial.

In one sentence. REO gives Daisy a reason to pick up the phone today — and the evidence for why now is the moment.

What's on screen. An "ignition" alert at the top of Daisy's screen: the headline event (Avonmore has acquired Calderwood), a confidence level, an estimated opportunity value, and a grid of "why this, why now" signals — each tagged with where it came from (Companies House filing, internal MI, market data).

The talk-over.

"This is where the day starts. Daisy already knows Avonmore inside out — seven years of relationship. What she *doesn't* know yet is that overnight the picture changed: her client has just acquired another company Lloyds already banks. REO caught the change-of-control filing before it hit the news, connected it to the relationship Daisy already owns, and surfaced it as a single alert — *this* client, *now*, and here's *why*. Notice it's not a raw data dump: it leads with the relationship context, then shows the signal, the estimated value, and the confidence — every claim traceable back to a cited source. Daisy hasn't done any research. She's just been handed a qualified reason to act."

Features on this step. *(v4 breaks the old single hero into six labelled cards.)*

#	Card / feature	What it is — and how to explain it
1	The opportunity (hero)	The headline event (Avonmore has acquired Calderwood), a confidence level, the predicted opportunity value and the predicted need. A qualification chip sits inline — appetite band, confidence, product suitability — so it's qualified at a glance. "What surfaced, how sure we are, and roughly what it's worth."
2	Why this, why now	The supporting-signals grid. Each signal card names the source (Companies House, internal MI, market data) <i>and</i> its data horizon (historical / live / predicted). "Every claim is evidenced — nothing is a black box."
3	Pre-qualification checks	A row per red-line check — jurisdiction, sector limit, sanctions — each marked pass or flag. "The non-starters are checked <i>before</i> Daisy spends any time."
4	Coverage & ownership	Who owns the relationship, who to notify (Marcus), and a private-side hook flag. "Clear ownership so two teams don't trip over each other."
5	Peer / sector benchmark	A headline plus stat rows and evidence showing how this opportunity compares to sector peers. "It's validated against comparators, not just asserted."
6	Why now + action	The plain-English "why now" line and a one-click Prep this meeting button that builds the briefing. "One tap and she walks in prepared."

The point. We're not replacing the RM's relationship — we're making sure she never misses the moment. Proactive, evidence-based, and she moves first.

Scene 2 · Relationship Intelligence

The full group picture — before you walk in.

In one sentence. Before the meeting, Daisy sees the whole relationship — seven years of it — in one place.

What's on screen. A relationship view for the Avonmore Group: a health score, a 12-month sentiment trend, a network map of contacts across both Avonmore and Calderwood, and a full interaction history across channels (meetings, calls, emails, CRM notes) — with a marker for what's shared with the team versus Daisy's personal notes.

The talk-over.

"The ignition alert told Daisy *why now*. This scene gives her the *context* before she walks in. It's not a point-in-time snapshot — it's the whole relationship: how healthy it is, how sentiment has moved over the last year, who the key contacts are across both companies, and every touchpoint that's ever happened. Crucially, this includes Marcus's side — the Calderwood contacts — so for the first time she's looking at *one group*, not two separate files. And this knowledge belongs to the bank, not to Daisy's memory or her inbox. If she were off tomorrow, whoever picked this up would have all of it."

Features on this step.

Feature	What it is — and how to explain it
Group contact network map	A map of entities, contacts, coverage and tie-strength across Avonmore and Calderwood. "Who we know, how well, on both sides of the new group."
White-space contact discovery	New contacts found via an external source (e.g. Apollo) that the bank isn't yet connected to. "It even shows the people we <i>should</i> know but don't."
Relationship health gauge + trend	A group health score out of 100 with a direction of travel. "One number for how strong the relationship is, and which way it's moving."
Sentiment index (12 months)	AI-derived from tone and responsiveness over the last year. "How the mood has trended, not just today's snapshot."
Engagement metrics	Interactions logged, touchpoints per month, sentiment delta. "Tangible proof of engagement, not a gut feel."
Single-thread risk	A key-person / concentration flag. "A warning if the whole relationship rests on one contact."
White-space to cover	The coverage gaps still to close. "Where the relationship is thin and needs attention."
Knowledge visibility	Marks what's shared with the team versus Daisy's personal notes. "Makes institutional memory visible — and shareable."
Interaction history	Every touchpoint across both threads and all channels — meeting, call, email, CRM, Teams. "The complete record, across both coverage teams."

The point. The relationship is the asset, and it's owned by the bank — not trapped in one person's head. This is the "human relationship first, technology enables" framing.

Scene 3 · Activate Intelligence

Walking into the room — consent on, live support ready.

In one sentence. With the client's consent, Daisy switches on live support for the conversation — and if they decline, notes mode does the same job by hand.

What's on screen. A mobile-style consent gate: a clear confirmation that the client has agreed to the meeting being captured, with the flagged M&A event shown as a pre-read. If consent isn't given, a notes-capture fallback (typed, voice-to-text or handwriting).

The talk-over.

"Now Daisy's in the room. Before anything is captured, consent is confirmed — visibly, honestly. The framing matters: this isn't surveillance, it's *enabling a better conversation*. With consent on, REO can listen and give Daisy live support. And if the client says no? That's fine — notes mode captures the same information manually, and REO structures it into exactly the same outputs afterwards. Daisy stays in control the whole time, and the client always knows what's happening."

Features on this step.

Feature	What it is — and how to explain it
Consent confirmation gate	Verifies and re-confirms consent before any capture; capture is always optional. "Nothing is recorded until the client agrees — explicitly."
Pre-read opportunity brief	The flagged M&A event shown on arrival. "She walks in already briefed on why this meeting matters."
Secure live capture	On-device transcription with real-time key-moment detection. "Captured securely, on the device, as it happens."
Notes-mode fallback (typed)	A typed capture surface for when the client declines recording. "If they say no to recording, she still captures the key points."
Voice-to-text capture	Dictate notes hands-free; they appear as text. "Speak the notes instead of typing them."
Handwritten tablet capture	A digital-pen notebook — handwriting is recognised and synced. "Even handwritten notes get digitised and structured."
Uniform post-meeting structuring	Any capture path — transcript, typed, voice or handwriting — produces the <i>same</i> summary, CRM update and follow-ups. "However it was captured, the output is identical."

The point. Trust first. The capability works *with* consent, degrades gracefully without it, and the human is always in control.

Scene 4 · Live Client Moment

Sarah names the need — REO shapes it in the instant.

In one sentence. The moment the client voices a need, REO recognises it, shapes it into an opportunity, and tells Daisy what to say next.

What's on screen. A live transcript with speaker attribution and a recording timer. As Sarah speaks, REO classifies the conversation live — intent, risk, opportunity, context, emotion — and surfaces an in-the-moment prompt: the next best question and the commercial rationale behind it. A draggable panel lets Daisy hide the AI to stay present.

The talk-over.

"This is the heart of it. Sarah, the CFO, starts talking about refinancing the acquisition and bringing the two businesses' banking together. The old way, Daisy makes a mental note and reconstructs it later. Here, the instant Sarah names the need, REO recognises three things *at once* — the intent to refinance and consolidate, the risk of fragmented ownership and banking, and the shape of the deal: acquisition finance, cash, FX. And it doesn't just record it — it hands Daisy the *next question* and the reason to ask it. Need and opportunity surface as a single moment, not two separate steps. And she can swipe the AI away any time to stay eye-to-eye with her client."

Features on this step.

Feature	What it is — and how to explain it
Live transcript	A real-time, speaker-attributed stream of the conversation. "You can see who said what, as it's said."
Recording status + timer	A visible REC indicator and elapsed time. "Always clear when capture is on — no hidden recording."
Real-time signal detection	Classifies the talk live into need / risk / opportunity / context / emotion. "It reads the conversation and tags what matters, instantly."
In-conversation opportunity shaping	A confirmed need is turned into a shaped, sized opportunity there and then. "The need becomes a valued opportunity before the meeting ends."

Feature	What it is — and how to explain it
In-moment guidance prompt	The next best thing to say — insight, rationale, suggested action, value and timing. "It hands Daisy the next question <i>and</i> why to ask it."
Draggable insight sheet	Daisy can surface or hide the AI insights with a drag. "She can push the AI away to stay present, then pull it back."

The point. Revenue gets shaped *in the room*, not rebuilt from notes afterwards — and the AI makes the human a better listener, not a distracted one.

Scene 5 · Deal Structuring & Win Strategy

Shape the right facility before it goes to credit.

In one sentence. REO proposes three deal structures built around the client's situation, and Daisy picks the one that serves Avonmore best.

What's on screen. Three structure options, each with facility components, indicative terms, indicative economics, and — importantly — an indicative credit-eligibility status (approvable / needs review / needs escalation). An "explore" vs "committed" toggle, a "why this structure" rationale, and a one-click "loop in a product specialist" action.

The talk-over.

"Now Daisy shapes the deal. REO gives her three options — but notice how they're framed: each one is built around *Avonmore's* situation — their cash-flow cycle, integrating Calderwood, the combined group's cash and FX position. Not the bank's product catalogue. Each option shows what it would cost, what it would return, *and* whether credit is likely to clear it — so Daisy knows what's realistic before she ever proposes it. She can explore freely in draft mode without touching the CRM, and if she needs specialist input, she loops in the right product colleague with one click. The bank's economics are shown — but they follow the client's need, they don't lead it."

Features on this step. (*v4 splits the old right-hand panel into separate cards — economics, terms, hand-off and the decision each read on their own.*)

Feature	What it is — and how to explain it
Exploring / Committed toggle	A draft-mode switch. In <i>Exploring</i> , the CRM is untouched and options can be compared freely; <i>Committed</i> is needed to confirm. "She can play with

Feature	What it is — and how to explain it
	options without opening anything for real."
Structure options	Three value-led structures (lean / recommended / stretch); the recommended one is badged Agent pick . "Three ways to do it, each built around the client — with a steer on the best."
Indicative credit eligibility	Each option carries a status up front — approvable / review / escalation. "She knows what credit will likely clear <i>before</i> she proposes it."
Parallel decision-fork tracks	Pick the stretch option and a shaping track and a credit-escalation track spin up side by side. "The non-linear moment — client shaping and credit run in parallel, no waiting."
Facility components	The building blocks of the chosen structure — core, risk, upsell, cash. "What the facility is actually made of."
Indicative economics	Deal value, Y1 revenue, RoRWA and client fit — priced live via the ePricer / EPC engine. "The numbers, priced live — and they rebuild when she changes the structure."
Indicative terms	Tenor, margin and key terms. "The headline terms of the deal."
"Why this structure" rationale	A plain-English explanation of the agent's recommendation, on each option. "It shows its reasoning, it doesn't just assert."
Product specialist hand-off	One action to loop in a named product partner, who then appears as looped-in with a note. "Specialist expertise pulled in with a single click."
Confirm → sent to credit	Locks the structure and price and routes it onward with no re-keying. "One confirm and it's on its way to credit, clean."

The point. RMs shape deals around client needs; REO does the analysis and the credit readiness. Client strategy leads, bank economics follow.

Scene 6 · Post-meeting Momentum

Captured once — available to everyone who needs it.

In one sentence. The conversation is captured once and flows automatically to everyone who needs it — no re-keying, and Daisy's next action is already waiting.

What's on screen. An auto-generated deal summary synced to CRM minutes after the meeting: key moments, deal components with values, a task list with owners and due dates, a notification that Marcus has been looped in, a drafted follow-up email in Daisy's voice, and a credit narrative REO has already drafted for her to review.

The talk-over.

"The meeting's over. In the old world this is where the admin tax kicks in — writing up notes, updating the CRM, chasing colleagues. Here, it's already done. REO captured the conversation once and pushed it everywhere it needs to go. The CRM updated itself. Marcus — the other RM — has been automatically notified that Calderwood is now part of a group mandate, so nothing falls between the two teams. There's a follow-up email already drafted *in Daisy's tone of voice*, ready for her to check and send. And REO has even drafted the credit narrative. Daisy's job now isn't to write any of this — it's to review it and move."

Features on this step.

Feature	What it is — and how to explain it
Auto-captured structured deal	The deal, generated from the live conversation and synced to CRM minutes after the meeting. "The write-up is already done, in the CRM."
Cross-coverage notification	Marcus, the other covering RM, is auto-notified of the deal. "The other team knows instantly — nothing falls between them."
Team visibility log	Shows exactly which colleagues can now see the record. "It's clear who has sight of this."
Key moments	The meeting's highlights, extracted. "The moments that mattered, pulled out automatically."
Deal components	The opportunities captured, each with value and confidence. "What the deal is made of, with numbers attached."
Actions to progress	A task list, each with an owner (agent or RM) and a due date. "Every next step has a name and a date against it."
AI credit-narrative preview	REO's drafted credit submission, reviewable before it goes to credit. "The credit story is pre-written for her to check."
Drafted follow-up comms	A client email in Daisy's tone — accept, edit or discard. "The follow-up is written in her voice, ready to send."

The point. Enter once, flows everywhere. The CRM stops being an admin burden and becomes a by-product of the conversation.

Scene 7 · Agent Bench & Orchestration

You orchestrate — agents progress the deal.

In one sentence. Daisy stays in the relationships; REO runs a bench of agents and colleagues in parallel to drive the deal toward credit.

What's on screen. An orchestration board in three tiers — **autonomous** (agents running on their own), **human-in-the-loop** (agent recommends, Daisy approves), and **RM-only** (judgement reserved for the human). A credit-progression strip shows stage, approvals done, and what's still missing. Cross-coverage: Marcus's sign-off appears as a human-in-the-loop item; a product specialist runs a parallel workstream.

The talk-over.

"This is the engine room. REO has assembled the right team — some are AI agents, some are human colleagues — and they're all working the deal in parallel: market research, the credit narrative, pricing, product structuring. The board splits the work into three tiers. Some things the agents just *do* — autonomously. Some things they recommend, but Daisy approves — for example, Marcus's cross-coverage sign-off surfaces here as a decision, not as a lost email. And some things stay firmly with the human — the judgement calls. Daisy isn't doing the work; she's orchestrating it. That means more time on the conversations only she can have, and fewer things falling through the cracks between teams."

Features on this step.

Feature	What it is — and how to explain it
Credit progression strip	Stage, narrative status, approvals done / total, and what's still missing. "Exactly where the deal is in credit, and what's left."
Team assembled	REO pulls the right agents and colleagues onto the deal. "It builds the team for this specific deal."
Three-tier orchestration board	Autonomous / human-in-the-loop / RM-only, with live counts. "Work is sorted by how much human control it needs."
Autonomous agent workstreams	Agents progressing tasks in parallel without needing sign-off. "The routine work just gets done."
Product-specialist parallel workstream	A product colleague running alongside the agents. "A human specialist working in parallel, in the same view."

Feature	What it is — and how to explain it
Human-in-the-loop approvals	The agent recommends; Daisy accepts or overrides, with accountability. "AI proposes, the human decides — and owns the decision."
Cross-coverage approval	Marcus signs off consolidating the relationship — accept or discuss. "The Daisy + Marcus moment, made real as a decision, not an email."
RM-only tier	The judgement tasks reserved for the human. "Some things never leave the RM's hands."

The point. The RM leads and orchestrates; REO runs the parallel workstreams. One orchestrator, clear human accountability — not "a swarm of random bots".

Scene 8 · Portfolio Opportunity Radar

The same play, repeated across your whole book.

In one sentence. What just happened for Avonmore now runs continuously across Daisy's entire portfolio — surfaced as today's three priorities, not a firehose.

What's on screen. A portfolio scorecard (book value vs targets), a smart-filter digest bar showing "today's three priorities" by default, and a ranked opportunity list — each card showing the trigger, the reason and the timing, plus what it was detected from. Product specialists can push ideas into the same list.

The talk-over.

"Everything we've just seen for one client, REO does across Daisy's whole book — always on. But here's the important design choice: it does *not* dump every signal on her. By default she sees *today's three priorities* — ranked by value and urgency. She can expand to the full list when she wants, but the default is a curated digest, because the risk with this kind of system is overwhelming the RM, not underwhelming them. Product specialists can also push relevant ideas to her through the same surface — so intelligence flows both ways. The Avonmore play isn't a one-off. It repeats wherever the conditions are right."

Features on this step.

Feature	What it is — and how to explain it
Portfolio scorecard	Book value against targets, with progress. "How the whole book is tracking to plan."
Smart-filter digest bar	A calm summary first — today's three priorities — with a live scan and an expand-for-the-full-list option. "The default is a digest, not a firehose."
Ranked opportunity list	Priority-scored opportunities, each with trigger, reason and timing. "Ranked by what's worth acting on now."
Data-horizon provenance	Every card shows what it was detected from. "You can always see the source and how fresh it is."
Product-suggests card	A specialist pushes an opportunity <i>in</i> — reverse proactivity. "Ideas flow both ways, not just RM to client."
Inline actioning	An "act now / on it" control on each opportunity. "She can action it right there, without leaving the list."

The point. Always-on origination that *respects the RM's attention* — a priority list, not a signal overload. This directly answers the "RM overload" workshop feedback.

Scene 9 · Unified Platform

One pane of glass — across the whole group.

In one sentence. One live view of the entire Avonmore Group relationship — client, deal and workflow — with a clear line of sight to what comes next.

What's on screen. A single view spanning both RMs and both entities: the deal's position across the five components (Identify → Qualify → Shape → Handover → Deepen), a full interaction log across Daisy's and Marcus's threads, the live workflow queue, and forward markers — next review date, next signal, next recommended action.

The talk-over.

"This is the consolidated view — one place where the whole Avonmore Group relationship lives. Both RMs, both companies, one record. You can see exactly where the deal sits in the journey, the full history of every interaction across both teams, and the workflow running live in the background — REO opening the credit case and routing it, rather than Daisy driving it by hand. And notice the framing: this is deliberately *not* the end of the story. The last thing this

screen shows isn't 'deal done' — it's what comes next: the next review, the next signal, the next action. The relationship is always live, not just when a deal is open."

Features on this step.

Feature	What it is — and how to explain it
Client 360 pane	Consolidated client context in a single view. "Everything about the client, in one place."
Deal pane	A live deal summary — value, stage, terms. "The current state of the deal at a glance."
REO-driven workflow queue	Next actions triggered by the deal stage — done / live / awaiting. "The workflow runs itself off the deal's stage."
Group glass pipe	The deal captured once, flowing end-to-end across the five components. "One thread of the deal, from Identify to Deepen."
Stage-triggered automation	A stage change fires the next action — REO opens the credit case, not Daisy. "Reaching a stage <i>is</i> the trigger; no manual PEGA case."
Interaction log	Every touchpoint across both coverage threads, shared vs personal. "The full shared history, both teams."
"What's next" strip	Next review date, next detected signal, link into the next cycle. "It points forward — this isn't the end."

The point. One platform, shared across the team, where the relationship is continuous — and the closing note points *forward*, not backward.

Scene 10 · Relationship Review & Next Cycle

The deal is live — and the next cycle has already begun.

In one sentence. The mandate is won, and REO has already detected the next opportunity — so the cycle restarts from a position of strength.

What's on screen. A quarterly relationship-review card for the Avonmore Group: the mandate live, covenant and engagement status, next actions grounded in the full deal history, and — critically — a fresh signal: a Midlands precision-engineering supplier exploring a sale, a potential bolt-on to the group. The card mirrors the Scene 1 "why this client, why now" format.

The talk-over.

"And here's the loop closing. The deal is done — but the relationship doesn't go quiet. REO keeps watching, and it's already surfaced the *next* opportunity: a precision-engineering supplier in the Midlands is exploring a sale — a natural bolt-on to the group Daisy just built. Look at the format of this card — it's the same 'why this client, why now' we opened with in Scene 1. That's deliberate. The cycle is restarting, but from a much stronger position: all the context, all the relationship history, all the knowledge from this deal is retained and ready. There's no cold start. The knowledge never walked out the door."

Features on this step. (*v4 breaks the next-cycle signal into separate cards, mirroring the new Ignition layout.*)

Feature	What it is — and how to explain it
Live group mandate	The facility, its status and the next review date. "The deal we just won, now live."
Covenants tracking	Each covenant's value against its limit, on-track. "We're monitoring the terms, automatically."
Engagement gauge + trend	A relationship review score out of 100 with a direction. "How strong the relationship is now, post-deal."
Engagement stats grid	Interactions, touchpoints and sentiment metrics. "The tangible engagement numbers."
Relationship highlights	What has strengthened since the deal closed. "Proof the relationship is deeper than before."
Next signal card	The next opportunity REO detected — Hartfield Precision, a potential bolt-on — mirroring Ignition with headline, confidence, value, predicted need and timing. "The next 'why this, why now' is already here."
"Why this, why now" triggers	The multi-source evidence grid for the next signal, already forming. "Evidenced from the start, just like Scene 1."
Next best actions	Three ranked actions drawn from the full relationship history. "The system learned from this cycle and is steering the next one."

The point. The relationship is a *cycle*, not a transaction. It never stops, and the institutional knowledge compounds instead of leaking away. This is the answer to "close with the ongoing relationship, not the deal outcome".

Quick-reference cheat sheet

Use this if you only have one line per scene.

#	Scene	Say this
1	Opportunity Ignition	"A qualified reason to call today — REO caught the M&A filing first."
2	Relationship Intelligence	"Seven years of the whole group relationship, in one place, before she walks in."
3	Activate Intelligence	"Consent on, live support ready — and it works with or without recording."
4	Live Client Moment	"The client names the need; REO shapes it into an opportunity in the instant."
5	Deal Structuring	"Three structures built around the client — economics follow the need, not lead it."
6	Post-meeting Momentum	"Captured once, flows everywhere — CRM, Marcus, credit, follow-up email, all done."
7	Agent Bench	"Daisy orchestrates; REO runs the bench in parallel with clear human sign-off."
8	Opportunity Radar	"The same play across the whole book — today's three priorities, not a firehose."
9	Unified Platform	"One live view of the group — and it points forward, not to 'deal done'."
10	Relationship Review	"The deal's live and the next signal's already here — the cycle restarts stronger."

Three messages to land no matter what

If the detail gets lost, these are the three things the whole demo exists to prove:

1. **Human relationship first, technology as the enabler.** Daisy owns the relationship and the judgement. REO surfaces, drafts and coordinates — it never replaces her.
2. **One orchestrator, clear accountability.** It's REO end-to-end, with human sign-off where it matters — not a scattering of disconnected bots or a black box.

3. **A continuous cycle, not a one-off deal.** The story closes by opening the next chapter — the knowledge compounds and belongs to the bank.
